Astrea Constellation		

1 Aim of the project

Design of a **satellite constellation** dedicated to communications relay between LEO satellites and between LEO satellites and the ground.

2 Scope of the project

This section establishes the scope of the project.

First of all, a preliminary design will be carried out in order to establish the basic parameters of the constellation and de satellites and to set a common point on which start de following areas of the project. This preliminary design will be based on the existing constellations in the market, the main requirements showed in the next section of this document and a few calculations.

Satellite development

- An establishment of the mission requirements that influence any parameter of the satellite will be developed. These requirements include size, weight, spacecraft subsystems and payload.
- The design of the satellites' payload will be carried out.
- The spacecraft subsystems (structure, power systems, thermal control, telemetry and command and AOCS) will be chosen among the offer of the market, following the stated requirements and ensuring the compatibility with the designed payload. The exact disposition of the different elements inside de CubeSat won't be indicated.

Orbital design.

- The orbit design will be accomplished according to the results of several studies such as visibility between satellites and between satellites and ground stations, collision avoidance, orbital decay avoidance and stated requirements as global coverage, low earth orbit, low latency. These studies won't be carried out to the last detail. The two main priorities of this reserach will be the global coverage keeping the costs at a reasonable level.
- The number of satellites and the number of orbital planes will be deducted from those studies.
- A study will be carried out to clarify if the Earth is the only celestial body that will influence the satellites or others, for instance, the Moon or the Sun will also have to be considered. This study will consist on a research of information and several calculations in order to arrive to a reliable conclusion.

Astrea Constellation		

- The specific existing legislation will be taken into an account and followed during all the orbit development.

Constellation Deployment.

- A comparison among the existing launch platforms will be carried out to find out the one that fulfills the mission requirements and a reasonable economical conditions.
- If the launch platform requires a window to be booked, a date will be chosen and the procedure that need to be followed to book it will be clarified.
- The recommendations of Joint Space Operation Center will be followed and their application form will be filled up to ensure all the launch procedure accomplishes the legislation.

Operation.

- An analysis will be done to clarify how many ground stations must operate and the possibility of placing a central one in UPC ESEIAAT.
- The requirements and costs of the ground station will be determined.
- Communication logistics and protocols will be defined.
- An end of life strategy will be designed according to CubeSat lifespan, orbit decay, replacement stratagem of the company and legislation procedures.

Exhibition.

- It will consist on a simulation of the constellation to show to the client how it works. Specifically, it will be displayed in video format.

3 Basic requirements of the project

Prepared by:	Revised by:	Charter acceptance by:
Date:	Date:	Date:

 Departament de Projectes d'Enginyeria UNIVERSITAT POLITÈCNICA DE CATALUNYA	ASTREA	Date: October 5, 2016 Page: 5/20 Code: Group 04: EA-T2016
Astrea Constellation		

Feature	Description
1	Provide communication relay between two LEO nanosatellites with a latency lower than 1 minute .
2	Provide communication relay between a LEO nanosatellite and the ground with a latency lower than 5 minutes ..
3	Back-up system prepared to handle up to two major failures in the system. A major failure can be defined as the loss of a client's satellite coverage because of a failure in the network.
4	Switch time after major failure happens, shall be below 6 hours .
5	Each Satellite Node volume should be equal or lower than a 3U Cubesat .
6	Each Node should be able to handle at least 25 Mbit/s of data rate.

Table 1: Project Requirements

4 Justification

One of the major drawbacks of satellites is their poor temporal resolution. Although they can gather high quality data, they frequently lose contact with ground stations as they orbit. Therefore, their connection is limited to once every few hours. Astrea's objective is to solve this issue by creating a network between ground stations and LEO satellites providing near real-time communication to the customer. A network like the aforementioned can only be carried out by a CubeSat constellation because they are economical and easily reproducible satellites, making their mass production affordable.

Another problem which is normally faced when designing a satellite is that the systems it contains become obsolete in a relatively short period of time. In order to prevent this premature obsolescence, we propose a constant refilling of the constellation, possible due to the low cost of CubeSat. Our preliminary study leads us to the fact that the orbit decay would make the CubeSats fall after 2 years of operation making us capable of updating the systems as the technology evolves.

Since 2013 CubeSat launches have experienced an incredible raise (as shown in Figure 1) mainly because of their economic advantage. The future projection shows that the launches are going to continue increasing. However, more than the half of these CubeSat constellations are going to be focused on earth monitoring or become multiple-point sensors [1]. In these situation, Astrea have the opportunity to take a unique position in the market,

Prepared by:	Revised by:	Charter acceptance by:
Date:	Date:	Date:

sharing the communication segment only with Kepler Communications[2].

Figure 1: Nanosatellites by launch years. Extracted from [3]

Currently, there isn't any mission involving a large number of satellites implementing inter-satellite connection. However, missions like **QB-50** and **Kepler** are going to use this technology. the objective of these missions and other small satellites related projects is exposed at the Table 1 . For Astrea, this is an imperative requirement since normally, the CubeSat that connects with ground it's not the same that stablish a link with the customer satellite. In addition, this will enable them to configure and maintain dynamic routes and manage intermediate nodes.

5 Internal Structure

5.1 Hierarchy

In order to build a work strategy, the project is divided in task that will be described later on. As the different tasks depend on each other, the project members have decided to follow a hierarchy. Every task is developed by a small team between 2 and 5 people depending on the amount of work the task requires.

Each small team has to have a coordinator which has two principal functions. The first one is to manage the group so he is responsible for the good organisation and progression of the task. The second is that he is the voice of the team. That means that the coordinator is the one who represents his work team when transferring information to the other group coordinators and the project managers and vice versa.

Over all the teams Boyan Naydenov is the project manager who ensures the project progress, manages people for major decisions and is the contact point with the costumer. Finally, Silvia González is the secretary in charge to write and delivery the minutes and agendas of each meeting. She is also in charge of the organization and storage of all the documents in BSCW.

Department	Coordinator	Team members
Orbits Design	Oscar Fuentes Muñoz	Lluís Foreman Campins
		Sílvia González García
		Víctor Martínez Viol
		Laura Pla Olea
Satellite Design	Pol Fontanes Molina	Fernando Herrán Albelda
		David Morata Carranza
Communications	Eva María Urbano González	Boyan Naydenov
		Josep Puig Ruiz
		Josep María Serra Moncu-nill
		Sergi Tarroc Gil
Constellation Deployment	Xavi Tió Malo	Joan Cebrián Galán
		Roger Fraixedas Lucea
		Marina Pons Daza

Astrea Constellation		

5.2 Documents organisation

The Astrea team has 17 members so it is essential to define protocol to organise all the documents and information found to take advantage of resources.

The main internal communication tool used is *Slack* which is a platform specialised in team communication. *Slack* defines itself as a real-time messaging, achieving and search for modern team which is interesting for us because it allows the group to communicate at all times for punctual doubts and small decisions. For major decisions a meeting date will be specified using doodle. Communication between the customer and project manager will be carried out via e-mail. Weekly meetings with the customer are scheduled every Thursday and will be formalised through the agenda.

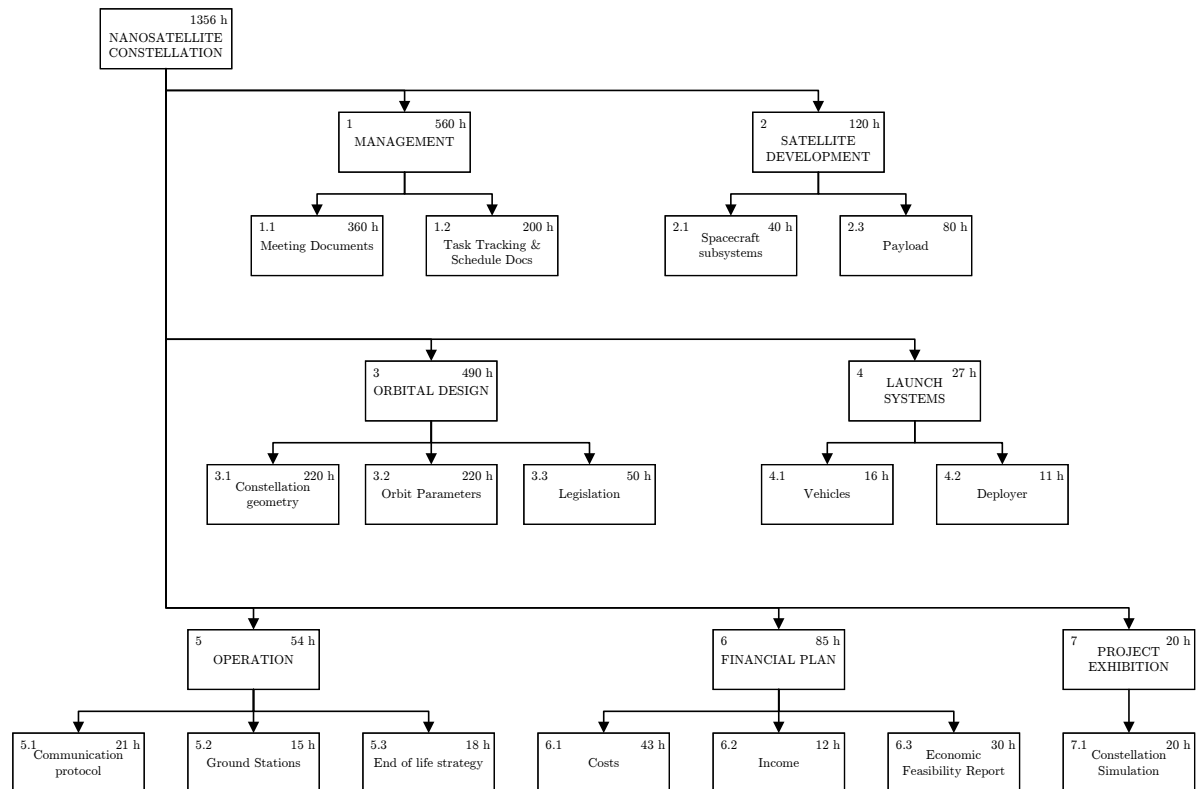

Moreover, to share documents we use two platforms: *Slack* and *BSCW*. On slack we put first drafts or documents that can be interesting. BSCW is the main information storage because information and documents are stocked and organised in folders.

At last, the text editor used to develop the project is Latex which combined with Git allows us to work remotely on a same document without overriding someone else's work. This work system is really interesting for such a big group in order to work on the same document while keeping a record of the changes.

6.2 Description of the tasks

ID	Work Package	Brief task description list
1. Management		
1.1	Meetings Documents	<ul style="list-style-type: none"> • <u>Writing agendas of the meetings:</u> The team's secretary will take note of the topics pending to debate and make a list to be checked by the team. • <u>Writing minutes of the meetings:</u> The team's secretary will take note of the debate and conclusions of the meeting.
1.2	Task tracking and scheduling	<ul style="list-style-type: none"> • <u>Project Charter:</u> A description of the project to develop is going to be detailed by all the group members during the first weeks. • <u>Team tasks monitoring:</u> The coordinator will ensure tasks compliance and register the progress. • <u>WBS and Gantt update:</u> The documents summarizing the project organization will be updated with final dates and final topics assessed.
2. Satellite		
2.1	Spacecraft Sub-systems	<ul style="list-style-type: none"> • Establishment of requirements once orbits are defined. • External enterprise hiring for hardware and software design.
2.2.1	Payload antenna	<ul style="list-style-type: none"> • Calculation of the size of the antenna needed to communicate with the other satellites. • Search the available antenna in the market that best fits the needs of the project.
2.2.2	Payload Data Handling System (PDHS)	<ul style="list-style-type: none"> • Selection of the configuration. • Establishment of the desired hardware and software. • Search the available PDHS in the market that best fits the needs of the project.
3. Constellation		
3.1	Constellation geometry	<ul style="list-style-type: none"> • <u>Number of satellites:</u> It is necessary to determine the total number of satellites in order to get global coverage. • <u>Distribution of the satellites:</u> Compute the correct distribution of these satellites.
3.2.1	General parameters	<ul style="list-style-type: none"> • <u>Parameter description:</u> Physical definition of the orbits for each satellite of the constellation.
3.2.2	Drifts	<ul style="list-style-type: none"> • <u>Orbit modifications:</u> Compute the possible orbit deviations of the different satellites.

3.3	Legislation	<ul style="list-style-type: none"> •<u>Research</u>: Study the legislation referred to nanosatellites. •<u>Implement</u>: Apply the necessary measures to accomplish the legal requirements.
4. Launch Systems		
4.1	Vehicle	<ul style="list-style-type: none"> •Study of the requirements for the launch of the cubesats. •Research of the main companies that offer launch services, including their features and costs. •Decision of the best launch system for our goal, regarding the requirements and the available technology.
4.2	Satellite Deployer	<ul style="list-style-type: none"> •Study of the requirements for the launch of the cubesats. •Research of the deployment systems that the main companies offer. •Decision of the best launch system for our goal, regarding the requirements and the available technology.
5. Operations		
5.1	Communication protocol	<ul style="list-style-type: none"> •Study the existing communication protocols. •Adapt the existing protocols or create new ones.
5.2	Ground station	<ul style="list-style-type: none"> •Determine the number of ground stations needed. •Design a model of a ground station capable of communication effectively with the constellation.
5.3	End of life strategy	<ul style="list-style-type: none"> •Study the existing end of life protocols. •Choose the protocol that applies to the satellites.
6. Financial Plan		
6.1.1.1	Maintenance cost analysis	•Determine maintenance costs related to the constellation and the ground station.
6.1.1.2	Insurance cost analysis	•Study of the insurance market and choosing the best option.
6.1.1.3	Administration cost analysis	•Determine how much it will cost to manage the constellation.
6.1.1.4	Taxes cost analysis	•Analysis of taxes related to the service provided and how it will affect the economic balance.
6.1.2.1	Manufacturing cost report	•Determine the cost of production of the different elements of the constellation.
6.1.2.2	Launching cost report	•Study of the best options in the market to launch the satellites and choosing one of them.
6.2.1	Price analysis	•Determine the price of the service provided for optimum income.
6.2.2	Revenue forecast	•Study of the demand for the service provided.
